

`./a.out 10`

Secondary
Memory
(Hard disk)

Commad line arguments

Stack

Heap

Data

Code

Primary
Memory
(RAM)

input

```
graph TD; input --> compiletime[Compiletime input]; input --> runtime[Runtime input]; input --> loadtime[Loadtime input];
```

Compiletime input

Ex : `int x = 10;`

Merit:

Faster execution.

Demerit :

Re-compilation is required to modify the value.

Runtime input

Ex : `scanf("%d",&x);`

Merit:

Re-compilation is not
Required to modify the value.

Demerit :

Slower in execution.

Loadtime input

Ex : `$. /a.out 10;`

Merit:

Faster in execution & re-compilation is not
Required to modify the value.

Demerit :

Conversion functions are required to take
a proper input for integers and floats.

Command line arguments (loadtime input) :

Providing the arguments to a program at command prompt along with executable file is called as command line arguments.

These inputs we are giving to a program at the time of executable file loading into main memory. So we also call it as loadtime input.

Ex : `./a.out 1234 22.7 A "vector"` --> these arguments are received by `main()`.

A `main()` can be written in 3 ways.

1. `main()`
2. `main(int argc, char *argv[]);` //for command line arguments
3. `main(int argc, char *argv[], char *env[]);` //for command line arg & environmental arguments

2. `main(int argc, char *argv[]);`

(or)

`main(int argc, char **argv);`

`argc` ---> argument count;

(no. of arguments at command prompt to a program.)

`argv` ---> argument vector; (all arguments are here)

Note : By default command line arguments are treated as strings.

Ex : `./a.out 1234 22.7 A vector;`

1. Here all the above arguments are treated as strings.

2. By default a string itself represents as base address.

3. Syntactical representation of string is **const char***

4. **argv is pointer (char **) , which points a char array of pointer base addr.**

./a.out 1234 22.7 A vector

```
#include<stdio.h>
int main(int argc,char *argv[])
{
    printf("argc = %d\n",argc);
    int i;
    for(i=0;i<argc;i++)
        printf("argv[%d] = %s\n",i,argv[i]);
}
